

Experiment No. 12

Problem Definition: 12. Build a Rails application to accept book information viz. Accession number, title, authors, edition and publisher from a web page and store the information in a database and to search for a book with the title specified by the user and to display the search results with proper headings.

Objectives of the Experiment: Understand

- Model View Controller architecture
- Rails as MVC
- Basic programming constructs of Ruby
- Use Ruby with Rails to build webpages

MVC

- Model View Controller - divides a given application into three interconnected parts
- High Cohesion Low Coupling
- MVC design pattern decouples major components allowing for efficient code reuse and parallel development

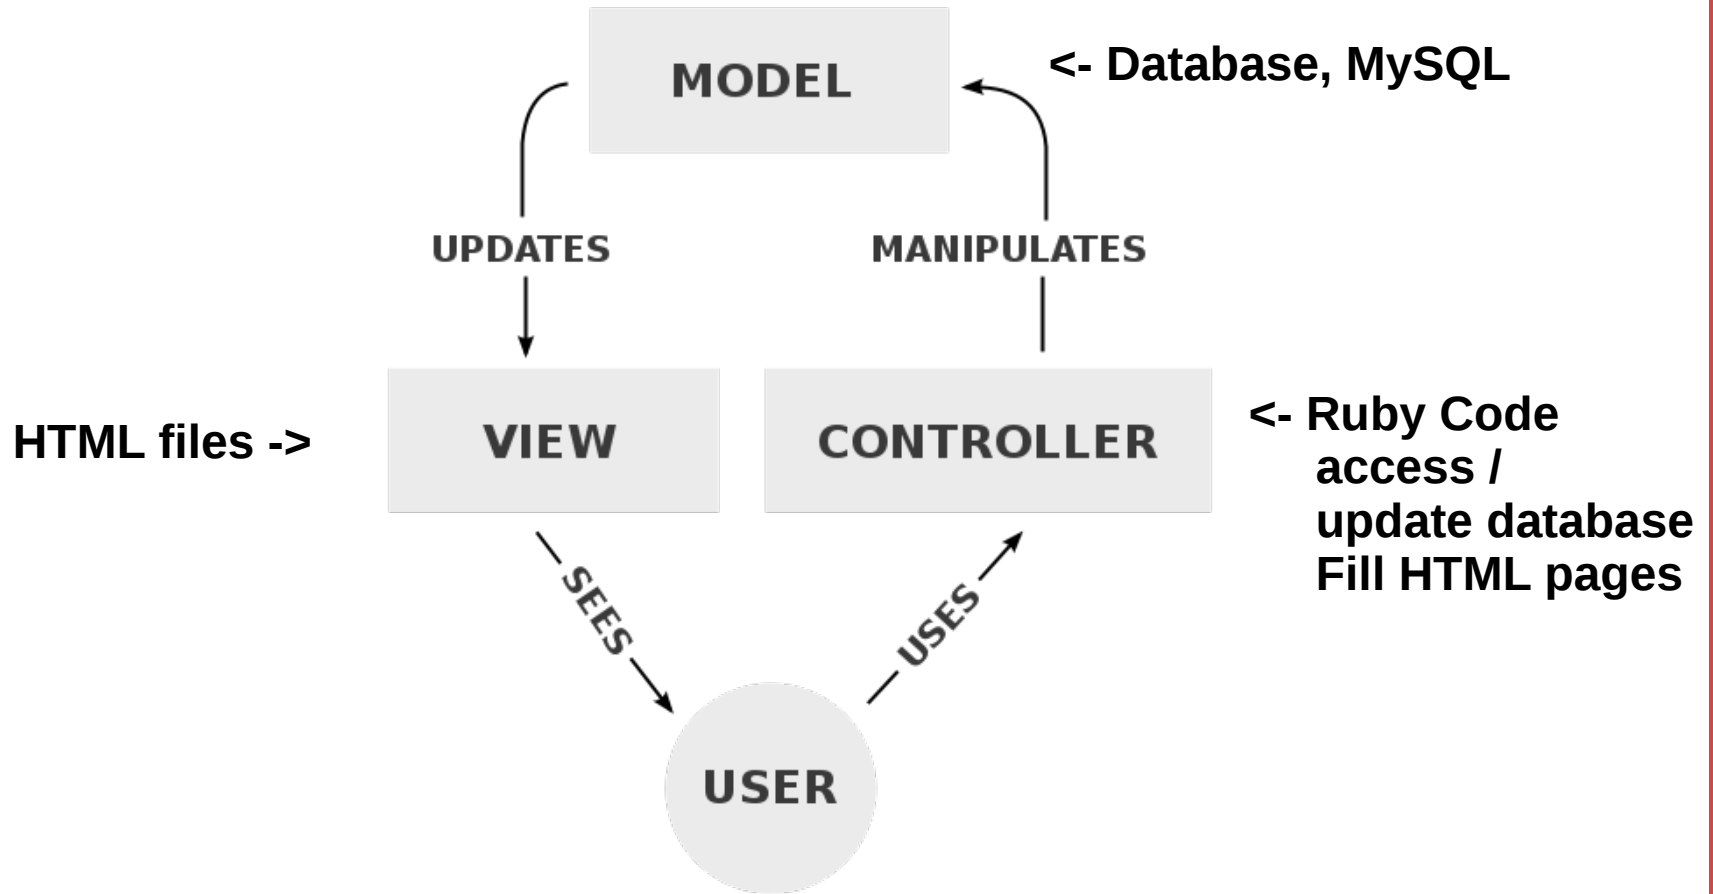

[http://guides.rubyonrails.org/getting_started.html]

Model View Controller

[Author – Regis Frey]

Model View Controller

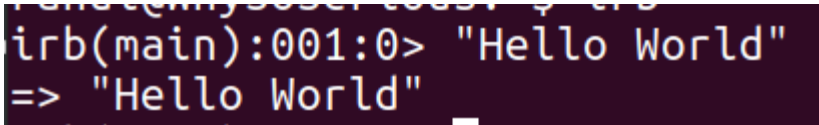

[Author – Regis Frey]

Ruby

[Linux, terminal - **irb**

Windows, open Interactive Ruby - Start Menu]

- A terminal window with a dark background. The prompt is 'irb(main):001:0>' and the input is '"Hello World"'. The output is '=> "Hello World"'.

```
irb(main):001:0> "Hello World"
=> "Hello World"
```

-

[<https://www.ruby-lang.org/en/documentation/quickstart/>]

Ruby

- An open source, object oriented scripting language
- Files saved with extension **.rb**

[<https://www.ruby-lang.org>]

Rails

- Rails, is a server-side web application framework written in Ruby under the MIT License – **Framework**
- Ruby on Rails
- Rails is a model–view–controller framework, providing default structures for a database, a web service, and web pages
- Write less code while accomplishing more than many other languages and frameworks
- But **should** adhere to rule of framework
- **Don't Repeat Yourself: DRY**
- Code is more maintainable, more extensible, and less buggy

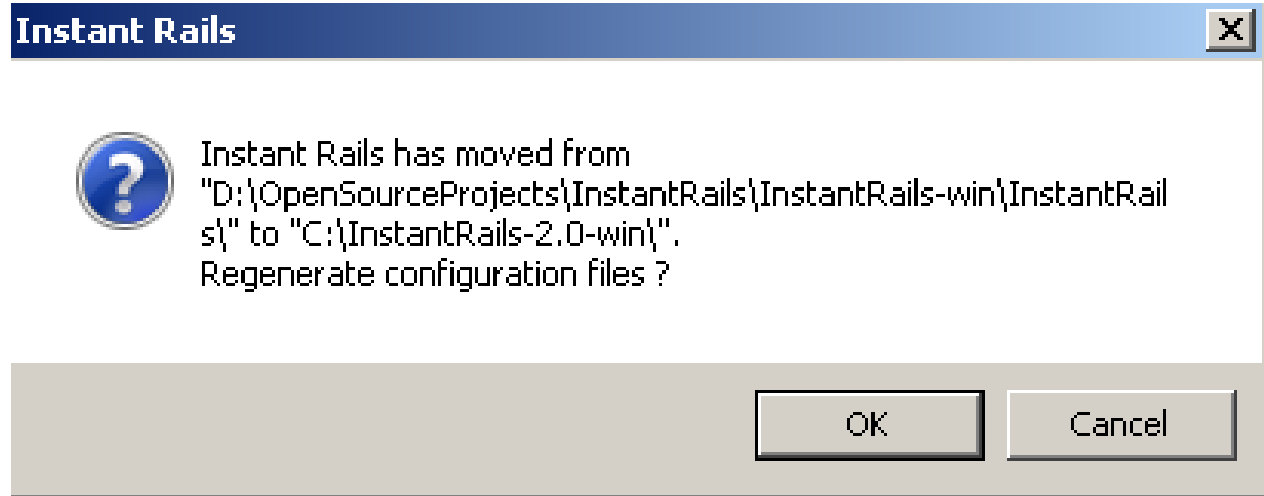

[http://guides.rubyonrails.org/getting_started.html]

Ruby on Rails – Instant Rails

- Rails Framework
 - Server - Apache , Puma or Mongrel
[Puma usually in UNIX like systems
Apache or Mongrel on Windows]
 - MySQL database
 - Ruby compiler
- [http://guides.rubyonrails.org/getting_started.html]

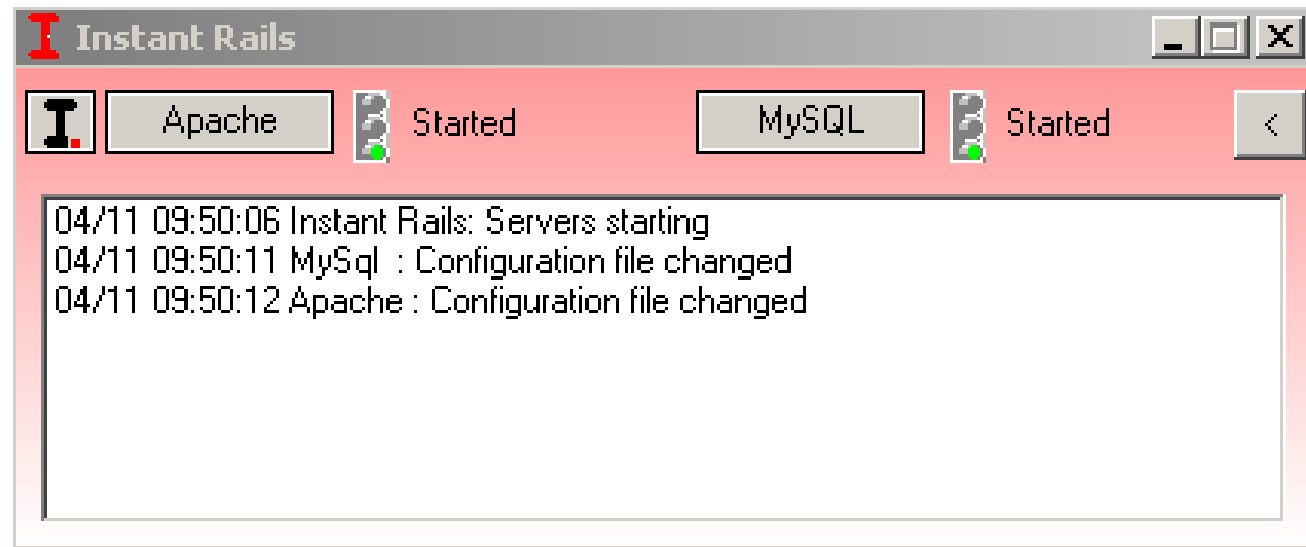

Ruby on Rails

- InstantRails-2.0-win
- Unzip InstantRails-2.0-win.zip into C drive
- Run **InstantRails** as admin

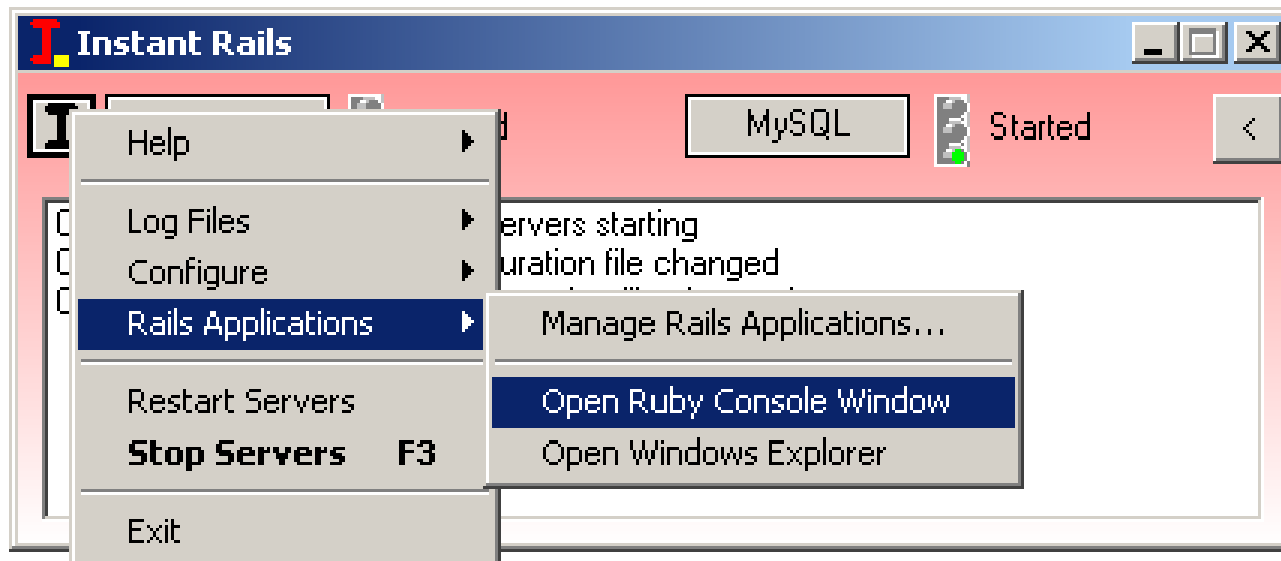

- Explore C:\InstantRails-2.0-win folder
- Readme.txt
- **help** folder **index.html** web page: details on Install and Verify

Ruby on Rails

Ruby on Rails

Ruby on Rails

```
Administrator: C:\Windows\system32\cmd.exe
C:\INSTAN~1.0-W>CD C:\InstantRails-2.0-win

               0 File(s)                0 bytes
               6 Dir(s)  57,894,445,056 bytes free

C:\InstantRails-2.0-win\rails_apps>
```

Ruby on Rails

A screenshot of a Windows command prompt window. The title bar reads "Administrator: C:\Windows\system32\cmd.exe". The command prompt shows the directory "C:\InstantRails-2.0-win\rails_apps" and the command "mysql -u root" being entered. The window has standard Windows window controls (minimize, maximize, close) in the top right corner.

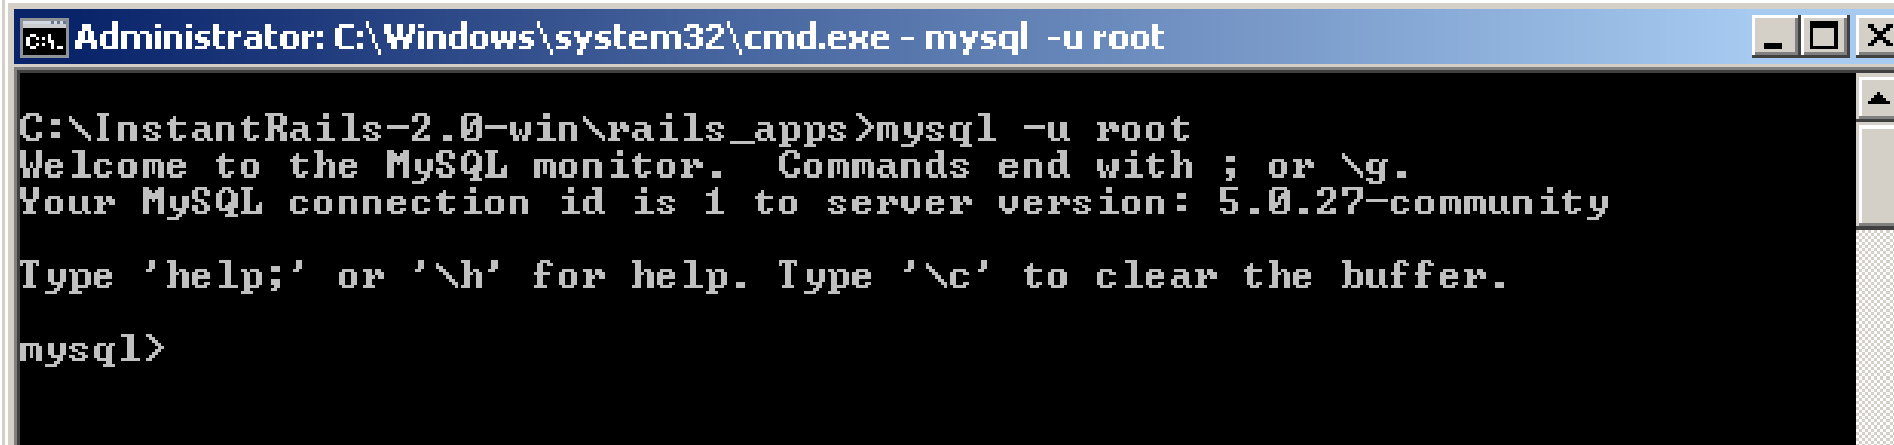

```
Administrator: C:\Windows\system32\cmd.exe  
C:\InstantRails-2.0-win\rails_apps>mysql -u root
```

Ruby on Rails

```
Administrator: C:\Windows\system32\cmd.exe

C:\InstantRails-2.0-win\rails_apps>mysql -u root
```

```
Administrator: C:\Windows\system32\cmd.exe - mysql -u root

C:\InstantRails-2.0-win\rails_apps>mysql -u root
Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 1 to server version: 5.0.27-community

Type 'help;' or '\h' for help. Type '\c' to clear the buffer.

mysql>
```

Ruby on Rails

```
mysql> create database lab15_development;
```

```
create database lab15_test;
```

```
create database lab15_production;
```

- Why three databases ?

Ruby on Rails

```
use lab15_development;
```

```
create table books
```

```
(  id int not null auto_increment ,  
   name varchar(80) not null,  
   description text not null,  
   price decimal(8,2) not null,  
   primary key(id)  
);
```

```
exit;
```

[do not change attribute name **id**, unless you wan to make changes in select clause also]

Ruby on Rails

```
rails -d mysql lab15
```

[On UNIX like platform : on terminal
rails new -d mysql lab15]

[-d , database]

```
cd lab15
```

Ruby on Rails

Folders created :

- app - controllers, models, views, helpers, mailers, channels, jobs and assets for your application
- config - application's routes, database
- db - current database schema
- log - Application log files
- public - Folder seen by the world as-is, contains static files and compiled assets
- test - unit tests, fixtures, test apparatus

Ruby on Rails

Set up scaffold

- **scaffold** in Rails is a full set of model, database migration for that model, controller to manipulate it, views to view and manipulate the data, and a test suite for each of the above

```
ruby script/generate scaffold Book name:string  
description:text price:float
```

```
[ In UNIX like system : bin/rails generate scaffold Book  
name:string description:text price:float ]
```

Ruby on Rails

- Start server (**NOT** the XAMPP)

ruby script/server

[In UNIX like systems : ruby server]

- <http://localhost:3000>
- <http://localhost:3000/books>

Ruby on Rails

- `http://localhost:3000/books`

Ruby on Rails

- Create two rails html : rhtml files
welcome.rhtml and result.rhtml
And
Save them in **app\views\main** of your Rails application
folder , in this case lab15
lab15\app\views\main

welcome.rhtml
and
result.rhtml

Ruby on Rails

- welcome.rhtml

```
<html>
<title></title>
<body>
  <p> Total number of books=<%=@num_books%> </p>
  <form action="result">
    Enter the searching element:
      <input type="text" name="sid"/>
      <input type="submit" value="Search"/>
  </form>
</body>
</html>
```

Ruby on Rails

- `result.rhtml`

Ruby on Rails

```
<html>
  <title></title>
  <body>
    <p> Entered book id is <%= @bookid %>
    </p>
    <form>
      <table border=1>
        <tr>
          <th>Book id</th>
          <th>Book name</th>
          <th>Details</th>
          <th>price</th>
        </tr>
```

- ```
<% @bookz.each do |bk|
 @id=bk.id
 @name=bk.name
 @descp=bk.description
 @price=bk.price %>
```

```
<tr>
 <td> <%= @id %> </td>
 <td> <%= @name %> </td>
 <td> <%= @descp %> </td>
 <td> <%= @price %> </td>
</tr>
```

```
<% end %>
```

# Ruby on Rails

- 

```
</table>
</form>
</body>
</html>
```

# Ruby on Rails

( To exit from server Control C )

- Create controller :

```
ruby script/generate controller main
```

- Open app\controllers folder
- Open main\_controller.rb to edit

# Ruby on Rails

- main\_controller.rb

```
class MainController < ApplicationController
 def welcome
 @num_books=Book.count
 end

 def result
 @bookid=params[:sid]
 @bookz=Book.find(:all,:conditions=>["name=?",@bookid])
 end
end
```

# Ruby on Rails

- Copy created rhtml files in app\views\main
- Start the server again :
- <http://localhost:3000/main/welcome>

# Ruby on Rails

- Copy created rhtml files in app\views\main
- Start the server again :
- <http://localhost:3000/main/welcome>

Total number of books=1

Enter the searching element:

# Ruby on Rails

- Copy created rhtml files in app\views\main
- Start the server again :
- <http://localhost:3000/main/welcome>

Total number of books=1

Enter the searching element:

# Ruby on Rails

- Copy created rhtml files in app\views\main
- Start the server again :
- <http://localhost:3000/main/welcome>

Entered book id is Mankuthimmana Kagga

Book id	Book name	
2	Mankuthimmana Kagga	Mankuthimmana Kagga, written by D. V. G

C:\ Administrator: C:\Windows\system32\cmd.exe

# Architecture of a DBI Application

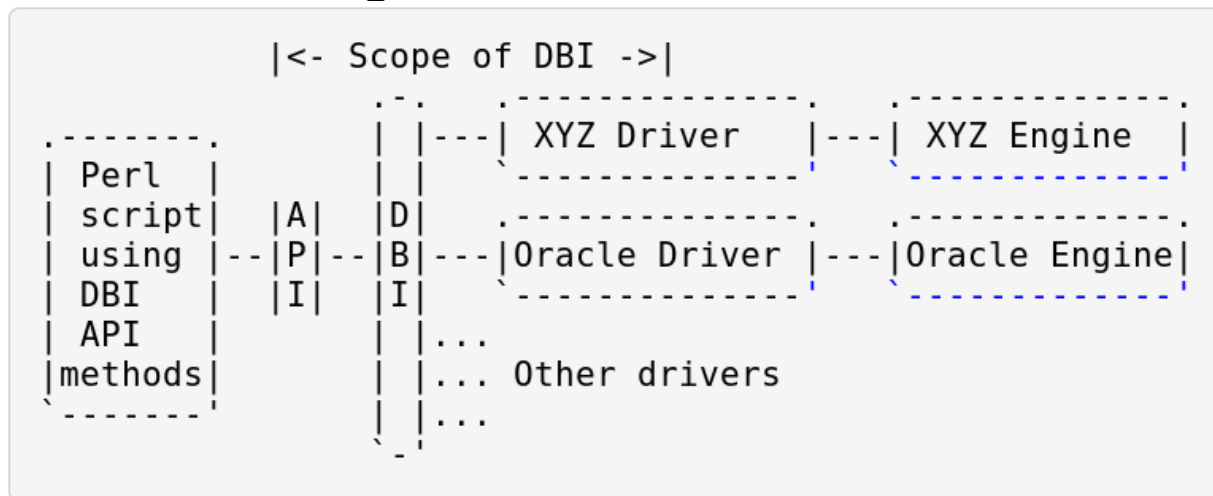

- DBI - Database independent interface
- Defines a set of methods, variables, and conventions
- Provide a consistent database interface, independent of the actual database being used

[ Tim Bunce, <https://metacpan.org/pod/DBI> ]

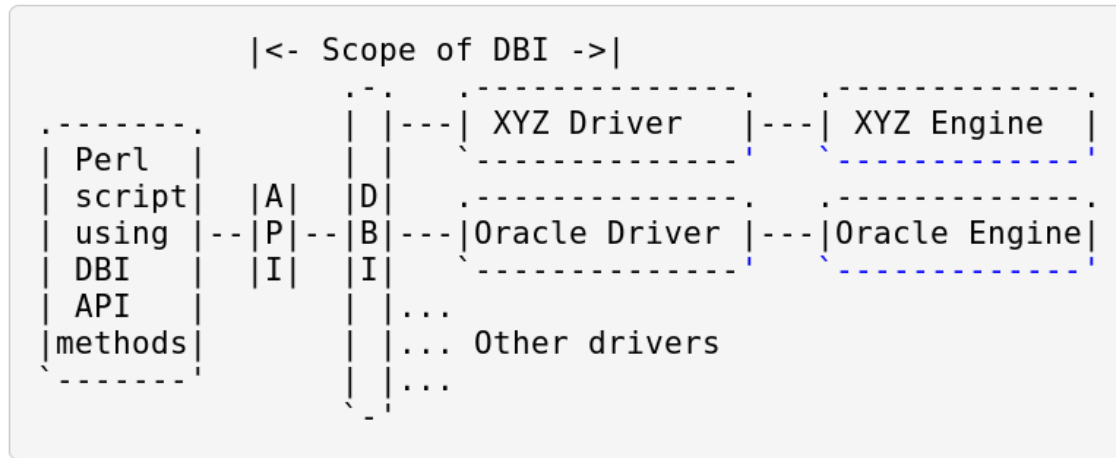

# Architecture of a DBI Application

- DBI - Database independent interface
- Defines a set of methods, variables, and conventions
- Provide a consistent database interface, independent of the actual database being used

- DBI is interface, a layer of "glue" between an application and one or more database driver modules
- Driver modules which do most of the real work

# Architecture of a DBI Application

- **API**, or Application Programming Interface, defines call interface and variables for Perl scripts to use
- API is implemented by the Perl **DBI** extension
- DBI "dispatches" the method calls to the appropriate driver for actual execution
- Driver contains implementations of the DBI methods using the private interface functions of the corresponding database engine

# Notation and Conventions

- 

<code>\$dbh</code>	Database handle object
<code>\$sth</code>	Statement handle object
<code>\$drh</code>	Driver handle object (rarely seen <b>or</b> used in applications)
<code>\$h</code>	Any of the handle types above ( <code>\$dbh</code> , <code>\$sth</code> , <b>or</b> <code>\$drh</code> )
<code>\$rc</code>	General Return Code (boolean: true=ok, false=error)
<code>\$rv</code>	General Return Value (typically an integer)
<code>@ary</code>	List of <b>values</b> returned from the database, typically a row of data
<code>\$rows</code>	Number of rows processed ( <b>if</b> available, <b>else</b> -1)
<code>\$fh</code>	A filehandle
<code>undef</code>	NULL <b>values</b> are represented by undefined <b>values</b> in Perl
<code>%attr</code>	Reference to a hash of attribute <b>values</b> passed to methods

# Usage

- To use DBI, first you need to load the DBI module:  
**use DBI;**

---

```
#!/"C:\xampp\perl\bin\perl.exe"
use DBI;
```

# Usage

- To use DBI, first you need to load the DBI module:  
**use DBI;**

```
#!/"C:\xampp\perl\bin\perl.exe"
use DBI;
```

- To "**connect**" to your data source and get a handle for that connection:

```
$dbh = DBI->connect($dsn, $user, $password);
```

# Usage

- To use DBI, first you need to load the DBI module:  
**use DBI;**

```
#!/"C:\xampp\perl\bin\perl.exe"
use DBI;
```

- To "**connect**" to your data source and get a handle for that connection:

```
$dbh = DBI->connect($dsn, $user, $password);
```

<b>\$dsn</b>	Data Source Name (DSN)
<b>\$user</b>	Username, owner of database
<b>\$password</b>	Authentication, password

# Usage

- To use DBI, first you need to load the DBI module:  
**use DBI;**

```
#!/"C:\xampp\perl\bin\perl.exe"
use DBI;
```

- To "**connect**" to your data source and get a handle for that connection:

```
$dbh = DBI->connect($dsn, $user, $password);
```

<b>\$dsn</b>	Data Source Name (DSN)
<b>\$user</b>	Username, owner of database
<b>\$password</b>	Authentication, password

# Usage

- To get to know dsn, user and password :  
<http://127.0.0.1/phpmyadmin/> or  
<http://localhost/phpmyadmin/>
- or
- config file
- or
- On terminal :

# Usage

- To get to know dsn, user and password :

```
$dsn="DBI:mysql:git";
$user="root";
$password="root";
$dbh = DBI->connect($dsn, $user, $password);
```

## Connect, query using PERL

- Depending on operating system : Driver name case sensitive
- Works fine on Windows but not on UNIX like operating system

```
$con=DBI->connect("DBI:Mysql:database=git","root","root");
```

## Connect, query using PERL

- Depending on operating system : Driver name case sensitive
- Works fine on Windows but not on UNIX like operating system

```
$con=DBI->connect("DBI:Mysql:database=git","root","root");
```

- Gives error :

```
install_driver(Mysql) failed: Can't locate DBD/Mysql.pm in @INC (you may need to
install the DBD::Mysql module) (@INC contains: /etc/perl /usr/local/lib/x86_64-
linux-gnu/perl/5.24.1 /usr/local/share/perl/5.24.1 /usr/lib/x86_64-linux-gnu/per
l5/5.24 /usr/share/perl5 /usr/lib/x86_64-linux-gnu/perl/5.24 /usr/share/perl/5.2
4 /usr/local/lib/site_perl /usr/lib/x86_64-linux-gnu/perl-base) at (eval 6) line
3.
Perhaps the DBD::Mysql perl module hasn't been fully installed,
or perhaps the capitalisation of 'Mysql' isn't right.
Available drivers: DBM, ExampleP, File, Gofer, Proxy, Sponge, mysql.
```

## Connect, query using PERL

- Depending on operating system : Driver name case sensitive
- Works fine on Windows but not on UNIX like operating system

```
$con=DBI->connect("DBI:Mysql:database=git","root","root");
```

- Instead use :

```
$con=DBI->connect("DBI:mysql:database=git","root","root");
```

# Connect, query using PERL

- D

[ <https://www.perl.com/pub/1999/10/DBI.html> ]

[ Author : Randal Schwartz from Portland, OR, USA ]

# Perl

- Perl : Perl is a general-purpose programming language originally developed for text manipulation and now used for a wide range of tasks including system administration, web development, network programming, GUI development
- Larry Wall, major : chemistry
- Perl 5
- The Swiss Army chainsaw of scripting languages
- Official Perl documentation states that :
  1. Larry is always by definition right about how Perl should behave. This means he has final veto power on the core functionality.
  2. Larry is allowed to change his mind about any matter at a later date, regardless of whether he previously invoked Rule 1.Got that? Larry is always right, even when he was wrong.

[ <https://www.perl.org/> ]

# Perl

- Supports both procedural and object-oriented (OO) programming
- Perl documentation : **perldoc**
- To solve a problem : There's More Than One Way To Do It
- Perl program generally saved with extension **.pl**
- **hello.pl**

```
print " Hello World \n "
```

- To run a Perl program
- XAMP installation , Windows : Perl available in  
C:\xampp\perl\bin\**perl.exe**  
( Or in UNIX like systems , if Perl is installed , directly : )
- **perl hello.pl**

```
perl hello.pl
```

```
Hello World
```

# Perl

- To run directly ( like a Shell Script : )
- As **first** line in program : **#!PathOfperl.exe**

---

**#!C:\xampp\perl\bin\perl**

---

**#!/usr/bin/perl**

- Then to run : **./hello.pl**

- Safety net :

```
#!/usr/bin/perl
use strict;
use warnings;
```

```
print " Hello World \n "
```

- **use strict;** will cause code to stop immediately when problem is encountered
- **use warnings;** will merely give a warning and let your code run  
[ <http://perldoc.perl.org/perlintro.html> ]

# Perl Script / Program

- No need to have a main() function
- Perl statements **end** in a semi-colon ;
- Comments start with a hash symbol and run to the end of the line

```
This is a comment
```

- Whitespace is irrelevant , except inside quoted strings :

```
print " Hello World \n "
```

```
;
```

```
print " Hello
World \n ";
```

```
Hello World
Hello
World
```

- Double quotes or single quotes may be used around literal strings

```
print " Hello World \n "
```

```
;
```

```
print ' Hello
World \n ';
```

```
Hello World
Hello
World \n
```

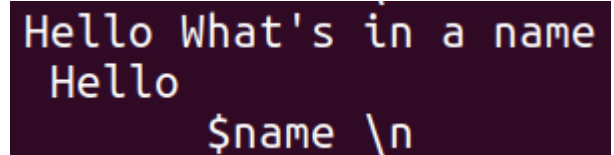

# Perl Script / Program

- Only double quotes "interpolate" variables and special characters such as newlines \n
- Single quotes treats as string

```
my $name="What's in a name";
```

```
print " Hello $name \n "
```

```
print ' Hello
 $name \n ';
```

```
Hello What's in a name
Hello
 $name \n
```

- Parentheses can be used for function's arguments or omitted
- Required to clarify issues of precedence

```
print("Hello, world\n");
```

# Perl variable types

- Scalars, Arrays and Hashes

- **Scalar** represents a single value

```
my $animal = "camel";
my $answer = 42;
```

- Scalar values can be strings, integers or floating point numbers, and Perl will automatically convert between them as required
- There is no need to pre-declare your variable types,
- But you have to declare them using the **my** keyword the first time you use them (One of the requirements of **use strict;** )

```
print $animal;
print "The animal is $animal\n";
print "The square of $answer is ", $answer * $answer, "\n";
```

```
camelThe animal is camel
The square of 42 is 1764
```

# Perl variable types

- Scalars, Arrays and Hashes

- **Array** represents a list of values

```
my @animals = ("camel", "llama", "owl");
my @numbers = (23, 42, 69);
my @mixed = ("camel", 42, 1.23);
```

- Arrays are zero-indexed

```
print $animals[0];
print $animals[1];
```

- Variable **`$#array`** tells you the index of the last element of an array

```
print $mixed[$#mixed];
```

- Array slice : get multiple values

```
@animals[0,1]
@animals[0..2]
@animals[1..$#animals]
```

# Perl variable types

- Scalars, Arrays and Hashes
- **Hashes** : represent set of key/value pairs
- Use whitespace and the => operator to lay them out

```
my %fruit_color = ("apple", "red", "banana", "yellow");
```

```
my %fruit_color = (
 apple => "red",
 banana => "yellow",
);
```

- To get at hash elements : `$fruit_color{"apple"}`

# Conditional and looping constructs

- if
- unless
- while
- until
- for
- foreach

# Conditional and looping constructs

- if **if** ( condition ) {  
    ...  
} **elseif** ( other condition ) {  
    ...  
} **else** {  
    ...  
}
- unless **unless** ( condition ) {  
    ...  
}  
Negated version of if

# Conditional and looping constructs

- if and unless

```
my $zippy="Two and a half";
my $bananas="";
the traditional way
if ($zippy) {
 print "Yow!";
}
the Perlsh post-condition way
print "Yow!" if $zippy;
print "We have no bananas" unless $bananas;
```

# Conditional and looping constructs

- while

```
while (condition) {
 ...
}
```

- until

Negated version of while

```
until (condition) {
 ...
}
```

```
print "LA LA LA\n" while 1;
```

# Conditional and looping constructs

- for

```
for ($i = 0; $i <= $max; $i++) {
 ...
}
```

- C style for loop
- Perl provides the more friendly list scanning **foreach** loop

- Can we expect this soon ?

```
for (ᳵi = 0; ᳵi <= ᳵmax; ᳵi++) {
 ...
}
```

# Conditional and looping constructs

- **foreach**  

```
my @animals = ("camel", "llama", "owl");
my @numbers = (23, 42, 69);
my %fruit_color = (
 apple => "red",
 banana => "yellow",
);
```

```
foreach (@animals) {
 print "This element is $_\n";
}
```

```
print $numbers[$_] foreach 0 .. $#numbers;
```

# you don't have to use the default \$\_ either...

```
foreach my $key (keys %fruit_color) {
 print "The \"$key\" is $key\n";
 print "The value of $key is $fruit_color{$key}\n";
}
```

# Builtin operators and functions

- Miscellaneous

# Builtin operators and functions

- Arithmetic

<code>+</code>	addition
<code>-</code>	subtraction
<code>*</code>	multiplication
<code>/</code>	division

- Numeric comparison

<code>==</code>	equality
<code>!=</code>	inequality
<code>&lt;</code>	less than
<code>&gt;</code>	greater than
<code>&lt;=</code>	less than OR equal
<code>&gt;=</code>	greater than OR equal

# Builtin operators and functions

- String comparison

<b>eq</b>	equality
<b>ne</b>	inequality
<b>lt</b>	less than
<b>gt</b>	greater than
<b>le</b>	less than OR equal
<b>ge</b>	greater than OR equal

- Boolean logic

<b>&amp;&amp;</b>	AND
<b>  </b>	OR
<b>!</b>	NOT

- Miscellaneous

# Builtin operators and functions

- Miscellaneous

**=** assignment  
**.** string concatenation  
**x** string multiplication  
**..** range operator (creates a list of numbers OR strings)

```
my $a=1;
```

```
$a += 1; # same as $a = $a + 1
print " a = $a";
```

```
$a -= 1; # same as $a = $a - 1
print " a = $a";
```

```
$a .= "\n"; # same as $a = $a . "\n";
print " a = $a";
```

# Files and I/O

- **open()** - open a file for input or output

```
open(my $in, "<", "input.txt") or die "Can't open input.txt: $!";
open(my $out, ">", "output.txt") or die "Can't open output.txt: $!";
open(my $log, ">>", "my.log") or die "Can't open my.log: $!";
```

- Read from an open filehandle using the `<>` operator
- In scalar context it reads a single line from the filehandle

```
my $line = <$in>;
my @lines = <$in>;
```

- In list context it reads the whole file in, assigning each line to an element of the list

[ Author : Kirrily "Skud" Robert <skud@cpan.org> ]

# Files and I/O

- **print()** can also take an optional first argument specifying which filehandle to print to :

```
my $message="Remember, Hope is a good thing, \n";
my $logmessage="maybe the best of things,
and no good thing ever dies - Stephen King\n";

print STDERR "Program testing can be used to show
the presence of bugs, but never to
show their absence!. - Dijkstra\n";

print $out $message;
print $log $logmessage;
```

- When completed with read / write operation on files : **close()**

```
close $in or die "$in: $!";
close $out or die "$out: $!";
close $log or die "$log: $!";
```

# Programming Style

- Object oriented or Function oriented
- use 

```
#!/C:\xampp\perl\bin\perl
use CGI; # load CGI routines
```
- CGI has routines to :
  - Retrieve CGI parameters
  - Create HTML tags
  - Manage cookie

```
#!/C:\xampp\perl\bin\perl
use CGI qw/:standard/; # load standard CGI routines
```

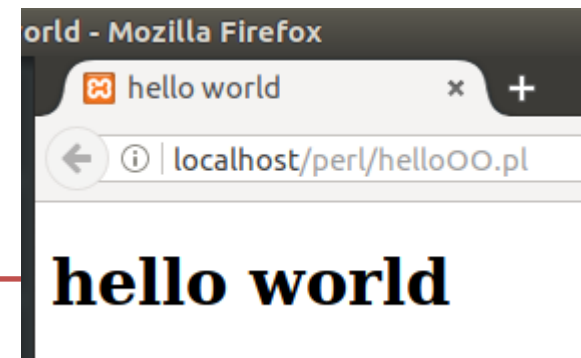

[ <http://perldoc.perl.org/CGI.html> ]

# Programming Style

```
#!/C:/xampp/perl/bin/perl
use CGI qw/:standard/; # load standard CGI routines

print (header()); # create the HTTP header
print start_html('hello world'); # start the HTML
print h1('hello world'); # level 1 header
print end_html; # end the HTML

<!DOCTYPE html

print "Server protocol : $ENV{'SERVER_PROTOCOL'}
";
print "CGI Revision : $ENV{'GATEWAY_INTERFACE'}
";
print end_html();
```

# Sample Run

**Server name :** localhost

**Server port :** 80

**Server software :** Apache/2.4.26 (Win32) OpenSSL/1.0.2l PHP/5.6.31

**Server protocol :** HTTP/1.1

**CGI Revision :** CGI/1.1

## 5a. Pseudo Code / Outline of the Algorithm

```
print "
 Server name : ", server_name() ,
 "
 Server port : ", server_port(),
 "
 Server software : ", server_software(),
 "
 Server protocol : ", server_protocol();
```

# FETCHING THE NAMES OF ALL THE PARAMETERS PASSED TO YOUR SCRIPT

- If the script was invoked with a parameter list
- `http://localhost/perl/script.pl?name1=value1&name2=value2`
- **param()** method will return the parameter names as a list

```
$value1 = param("name1");
```

```
$value2 = param("name2");
```

```
print " name1 = $value1
 name2 = $value2
"
```

```
name1 = Mukunda
```

```
name2 = Murari
```

# Invoke UNIX commands in Perl Script

- **system()** call , back ticks , quote execute
- system(command) , `command` , qx/command/
- Differences is in the returning value
- system call returns the **return value** of that command execution
- `` and qx return command execution's output

```
$cmd = param("cmd");
```

```
print "<h1>The output of $cmd is:</h1>";
```

```
print system($cmd) , "
";
```

```
print ` $cmd ` , "
";
```

```
print qx/$cmd/ , "
";
```

```
print qx{$cmd} , "
";
```

# Learning Outcomes of the Experiment

At the end of the session, students should be able to :

**1) Experiment with the database connections, query using Perl [L3]**

Acknowledgement : Thank to Sagar for Laptop to test XAMPP installation and working of programs on Windows 10
